

Insurance Claim Management System

Project Objective

The objective of this project is to simplify and automate the insurance beneficiary payout process.

When a policyholder passes away, the insurance company must verify the beneficiary claim before releasing the insurance amount. In a traditional process, employees perform these tasks manually by checking documents, sending emails for approvals, maintaining spreadsheets, and tracking the status through phone calls or paperwork.

This manual process is time-consuming, prone to errors, and difficult to monitor.

To solve this problem, I developed the Insurance Claim Management System, which automates the entire beneficiary payout process. The application ensures that every claim is routed to the correct person; approvals are taken according to business rules, and the claim is completed efficiently with complete traceability.

Why was this application created?

Imagine an insurance company receives hundreds of death claim requests every day.

Without an automated system:

1. Employees manually verify policy details.
2. Claims may be delayed because approvals depend on emails or phone calls.
3. Important documents may be missed.
4. High-value claims may be paid without sufficient verification.
5. Customers have to wait longer to receive their insurance amount.

The company therefore needs a system that:

1. Creates a claim digitally.
2. Verifies the claim.
3. Sends the claim to the correct employee.
4. Applies different approval levels based on the claim amount.
5. Tracks every action until the claim is completed.

This application fulfills those business requirements.

Real-Life Example

Let us consider a simple example.

Suppose Mr. Rahul purchased a life insurance policy.

Unfortunately, after a few years, Mr. Rahul passed away.

His wife, Mrs. Priya, is the nominee of the policy. She visits the insurance company to claim the insurance amount.

A Claim Assistant receives the request and creates a new insurance claim in the system by entering the policy details and beneficiary information.

Now the application decides what should happen next based on the Death Benefit Amount.

Scenario 1 – Claim Amount is ₹50,000

Since ₹50,000 is within the approval limit of the Claim Adjuster, the application routes the claim to the Claim Adjuster.

The Claim Adjuster verifies the documents and confirms that all information is correct.

Once the Claim Adjuster approves the claim, the insurance payment is processed and the claim is completed.

The Manager is not involved because the amount is within the authorized approval limit.

This helps the company process smaller claims quickly.

Scenario 2 – Claim Amount is ₹3,000,000

Now consider a high-value insurance claim.

Mrs. Priya submits a claim for ₹30,00,000.

Since this amount is above the predefined approval limit, the application directly sends the claim to the Manager for review.

If the Manager is satisfied with all the information, the Manager approves the claim and the payment is processed.

However, if the Manager notices missing information or incorrect documents, the Manager rejects the claim.

Instead of closing the claim, the application automatically sends it to the Claim Adjuster.

The Claim Adjuster reviews the Manager's comments, updates the necessary information, and submits the claim again.

The application then routes the claim back to the Manager for a final review.

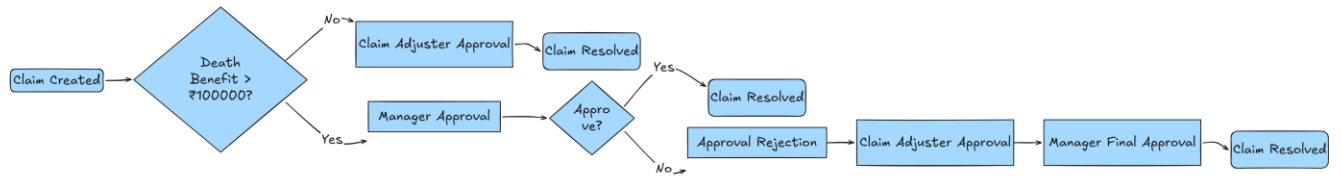

Once the Manager approves the corrected claim, the insurance payment is released and the claim is successfully completed.

Business Value

This application provides several business benefits:

1. Faster processing of low-value claims.
2. Additional verification for high-value claims.
3. Reduced manual effort.
4. Better transparency and tracking.
5. Complete audit trail for every approval.
6. Reduced processing time.
7. Improved customer satisfaction.
8. Secure and controlled approval process.

In simple words, this application acts like a digital workflow manager that ensures every insurance claim reaches the right person at the right time, follows the company's approval policy, and is completed accurately and efficiently.

SIMPLER FLOW

COMPLEX FLOW
